Sentinel S5

Fuel Asset Security

Monitoring parked vehicles and reviewing video evidence

Customer challenges / Product demos / Applications

Speaker: [Name / Title]

CUSTOMER CHALLENGE

Fuel loss at night

Overnight parking

Driver rest periods leave parked vehicles without active supervision.

Unattended vehicles

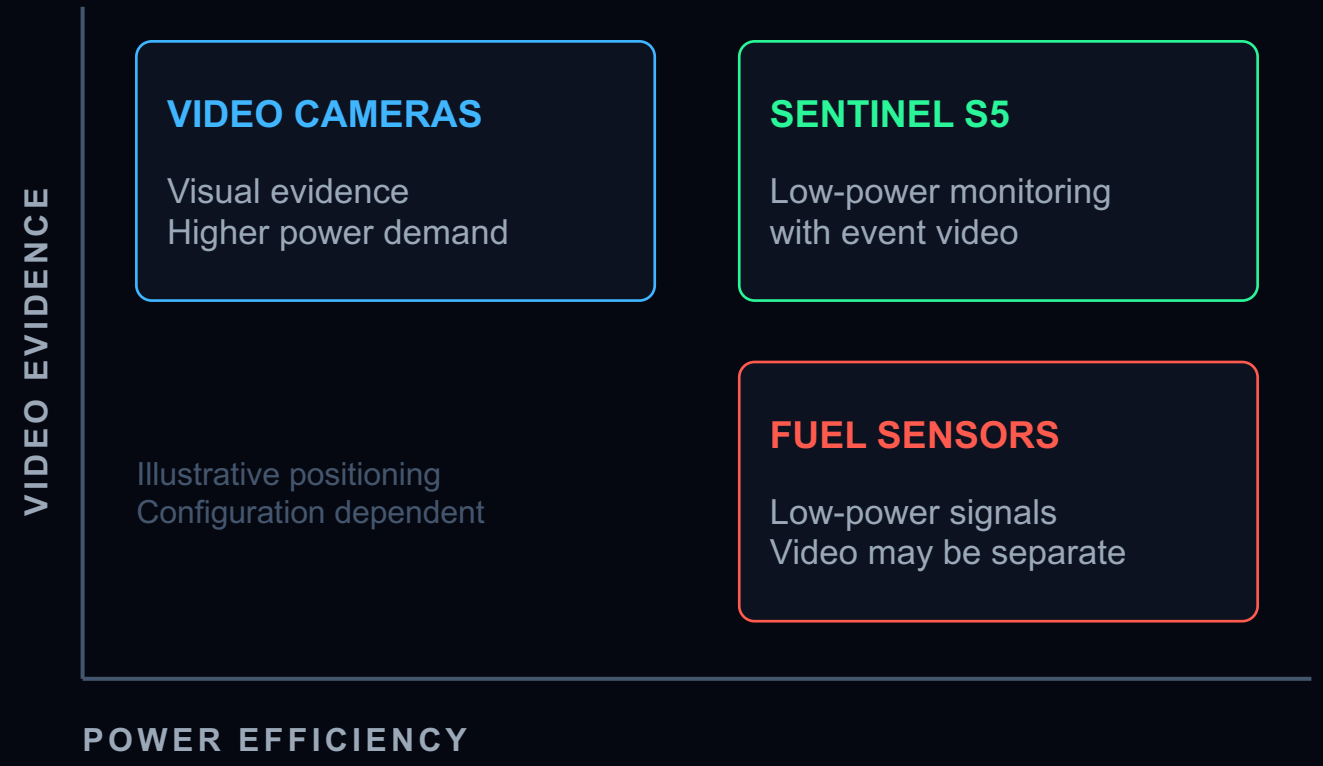

Small, repeated fuel losses can go unnoticed. Video evidence may be unavailable.

EXISTING SOLUTIONS

Trade-offs in existing solutions

Fuel sensors support monitoring with low power. Continuous video provides visual context but can increase power demand.

Long-duration monitoring with video evidence

Three key design questions

01 How can monitoring continue at low power after ignition-off?

02 How can human activity be detected in low-light conditions?

03 How can low-value alerts be reduced?

PRODUCT OVERVIEW

Sentinel S5 product overview

Low-power monitoring

Monitoring during vehicle downtime

Night-time detection

Human activity under low light

Behavior-based alerts

Events for fleet review

Integrated design

Connectivity and storage in one device

Video recording

Footage associated with events

Deployment setup

Mounting, power and camera calibration

Documented interfaces: 4G, Wi-Fi, GNSS, local storage, RS232 and I/O

AOV MONITORING

AOV low-power monitoring

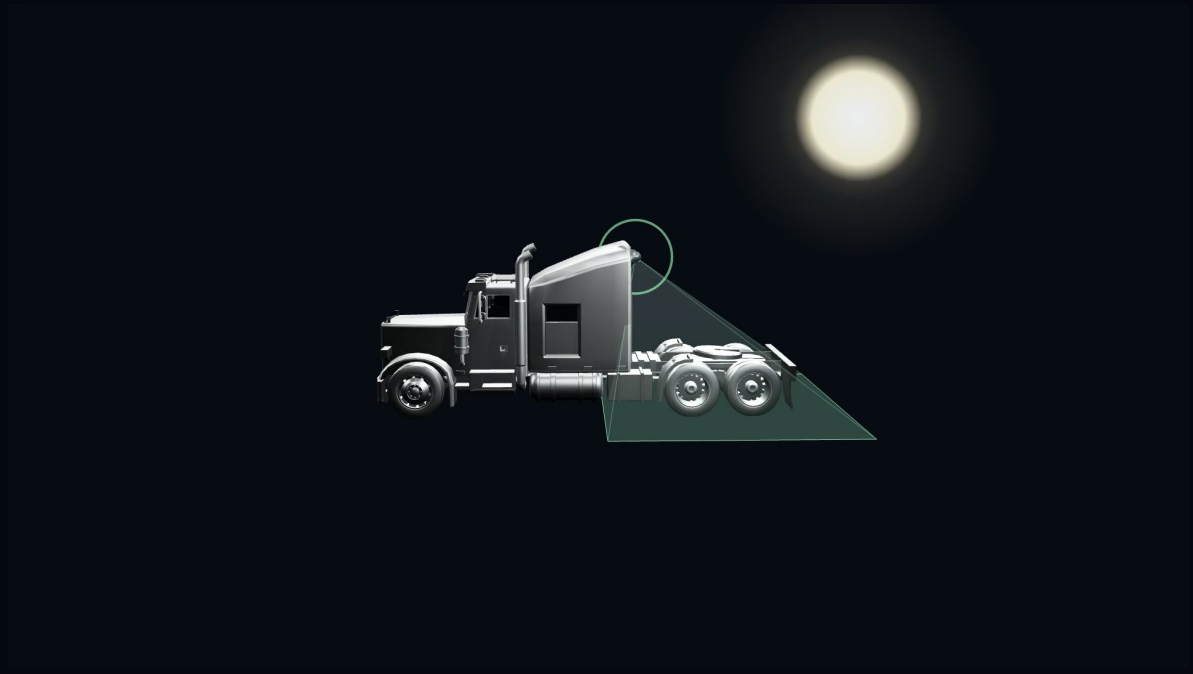

Monitoring continues after ignition-off using different recording modes.

- **Vehicle ignition-off**

  Monitoring remains active under configured conditions
- **Low-frame-rate sampling**

  Reduced sampling while no person is detected
- **Full-frame-rate recording**

  Person detection changes the recording mode

Click to play: day / night 3D and AOV footage

Illustrative mechanism. Runtime depends on power, activity, storage and configuration.

NIGHT-TIME DETECTION

Night-time detection

Low-light human detection supports monitoring. Identification depends on lighting, distance, motion and installation.

Phone reference

Supplied reference image

Camera reference

Supplied reference image

Black Light Ultra

Supplied reference image

Detection is different from identification. Comparison conditions require confirmation.

BEHAVIOR-BASED ALERT DEMO

Behavior-based alert demo

Review the difference between a person passing by and activity near the fuel tank.

1. **Walking past**

   Observe routine movement around the vehicle

2. **Suspicious activity**

   Flag behavior near a monitored area

3. **Event review**

   Check video evidence and on-site information

Click to play: 3D scenario and anonymized AI footage

Illustrative demo. An alert requires operational review.

INSTALLATION

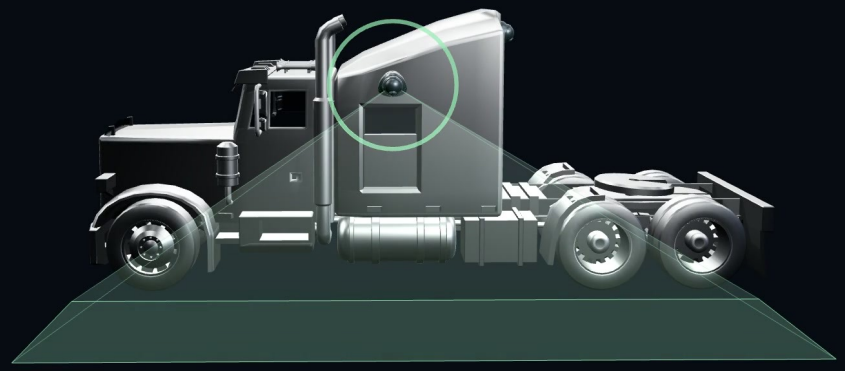

Installation & vehicle compatibility

Mounting position and angle determine the monitored area around the fuel tank.

Mounting positions

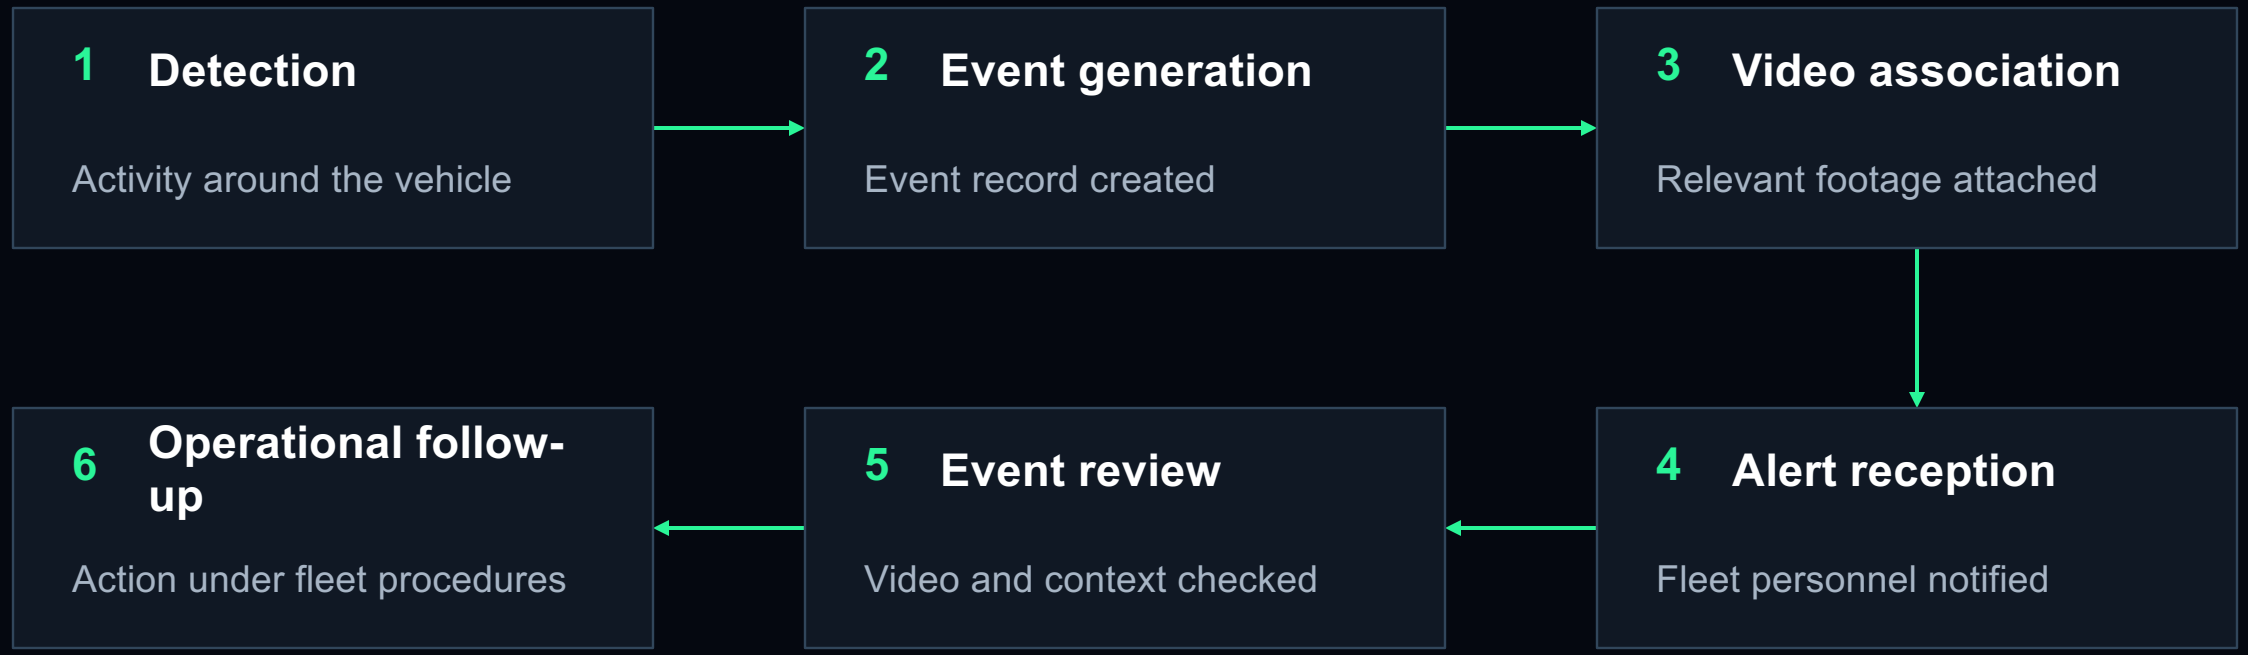

Roof, side or mirror-area candidates require vehicle-specific validation.

Camera angle and clear view
12V / 24V vehicle power
Connectivity and commissioning

Click to play mounting and monitored-area demo

Alert & video review workflow

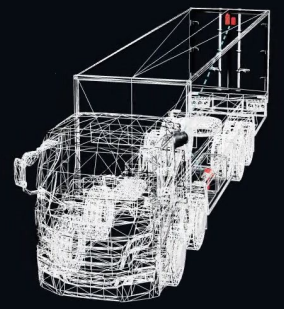

Notification channels and follow-up depend on platform configuration and fleet procedures.

SENSOR INTEGRATION

Sensor integration use cases

Sensor signals and video can support event verification.

- **Fuel sensors**
  Fuel-level change for review
- **Door sensors**
  Door-state event for review
- **Sensor signals**
  Documented RS232 and I/O
- **Video verification**
  Check footage and event context

Integration concept. Confirm sensor models, protocols and launch support before deployment.

Real-world incident & customer validation

PENDING CUSTOMER AND CONTENT APPROVAL

Pilot setup

[Approved vehicle type and installation]

Operating environment

[Approved parking context and observation period]

Approved incident footage

[Insert cleared video with identity, plate and location details removed]

Detection / Video evidence review / Customer verification

Kenya case study & business value

PENDING CASE APPROVAL AND DATA VALIDATION

Operating context: [approved fleet and installation context]

Comparison basis	Before installation	After installation
Observation period	[Period and exposure]	[Period and exposure]
Incidents per vehicle-month	[Validated value]	[Validated value]
Fuel loss per vehicle-month	[Validated value and unit]	[Validated value and unit]

Business implications: [approved finding and operational interpretation]

Limitations: matched periods, fleet exposure and external factors require review. Results may vary.

Key takeaways

Low-power monitoring

Monitoring during vehicle downtime

Night-time detection

Human activity in low-light conditions

Meaningful alerts & video evidence

Events that fleet teams can review
